There are also many inexpensive options available for people who can't afford the full version of Photoshop. This chapter explains how to create and edit images with the Photoshop elements in the digital darkroom. Starting with a photo Images can be manipulated in various ways to prepare them for printing or on the Web. This section explains how to perform the most common types of alterations. For more in-depth information on specific image-editing techniques, check out the upcoming sections. Importing a photo In this step, you can open an image file from your camera or scanner directly into Photoshop Elements. To import a photo, make sure that the camera or scanner you want to use is mounted or is connected to your computer. Then, follow these steps: 1. Choose File?Open and navigate to the location on your computer where you saved the file. 2. Double-click the image to open it and then click Open.

After the file has opened, the Image Size dialog box opens with the image displayed. The image displayed reflects the file's current resolution. Resolution refers to how many picture elements (pixels) make up the digital image. For example, a 13 megapixel image has about 13 million pixels. The Image Size dialog box displays the resolution. The color also changes when you change the resolution. For example, when you convert a photo from the RAW data on a camera to the JPEG file, the image size is reduced, and the image is very light in color. This photo is in the preview pane of the Image Size dialog box. You may see gray squares or a line at the top or bottom of the image. 3. Use the horizontal and vertical drop-down menus to display the desired range of horizontal and vertical pixels for the current resolution. If the image size looks good, press the OK button. If the file appears to be the wrong resolution, make sure that the camera or scanner is connected to your computer. You may also open the file from an external hard drive, jump drive, memory card, digital camera, or scanner. (Photoshop Elements converts most images to the JPEG file type by default — see the "Converting or Tagging Files" section, later in this chapter, for more info.) Editing photos You can edit photos, whether you have pictures on your computer's hard drive, media card, or thumb drive (usually saved as the RAW file type

Central regulation of protein synthesis. Many neural, secretory and endocrine responses depend on the production of new proteins. This process is regulated primarily by endocrine and paracrine signals, and reviewed here are some recent observations that may provide new insight into the molecular mechanisms underlying the central regulation of protein synthesis. A coordinated program of transcription, translation and degradation of key cytoskeletal proteins is responsible for the permanent regulation of muscle mass. An important mechanism contributing to the stabilization of protein expression is the phosphorylation of key components of the translational machinery, the ribosome and the initiation factor eIF2. Osmotic stress leads to phosphorylation of eIF2alpha on serine 51. This phosphorylation results in the stimulation of an autocrine and paracrine loop involving release of the ubiquitin E3 ligase Nedd4-2 which targets phospho-eIF2alpha for degradation by the proteasome. Interestingly, the repressor of eIF4E-binding protein (4EBP1) is phosphorylated on the equivalent sites and the phosphorylation of 4EBP1 and eIF4E leads to the stimulation of translation. Phosphorylation of eIF4E itself and of the S6 kinase and eIF4G2 is also reviewed. A synthetic peptide derived from the S6 kinase phosphorylation motif is capable of stimulating growth of brain cells in culture and in vivo.

Q: How to get the Identity for a Azure Access-Control-Allow-Origin request? I'm building a game in Unity. Unity can't access the data from my Amazon S3 bucket. I'm not sure if this is because I'm requesting with XHR or AJAX, but either way I am using the Azure Access-Control-Allow-Origin response header. How do I get the identity for this request? I'm using the JS helper classes in the Unity SDK to call my web services, but I'm not sure how to get the identity. I've tried this solution but I get null: `public GameObject hitObject(string text){ string[] parts = text.Split('.'); string type = parts[0]; string id = parts[1]; string body = (parts[2])? parts[2] : "" ; string url = "`

Technical Field The present disclosure relates to an electronic device such as a mobile terminal. Description of the Related Art Mobile terminals can be classified into two types according to appearance: bar-type mobile terminals and folder-type mobile terminals. In the same way, mobile terminals can be classified into two types according to structural differences: mobile terminals with a single display unit and mobile terminals with two display units. Mobile terminals with two display units, such as clamshell-type mobile terminals, can be further classified into two types: rotatable-type clamshell mobile terminals and sliding-type clamshell mobile terminals. When a clamshell-type mobile terminal includes a single display unit, a key pad and a fingerprint sensor are disposed at the front or rear side of the display unit and are always exposed to the outside. Therefore, the key pad and fingerprint sensor may be exposed to a user or a person carrying the mobile terminal, such that when an attempt is made to fingerprint the mobile terminal, the skin of the user or the person carrying the mobile terminal may be pressed in an undesired way, and thus a fingerprint may not be accurately or safely input. In order to protect the key pad and fingerprint sensor, a clamshell-type mobile terminal including a plurality of display units and two hinge modules can be used. In a clamshell-type mobile terminal with two display units, a keyboard can be disposed on one of the two display units, and
